

# Exercise 4.01 - Root module

---

## Step 1 - Create the files

- In the root folder, create 6 files: main.tf, outputs.tf, providers.tf, terraform.tfvars, variables.tf and versions.tf

## Step 2 - Edit the files

- The variables are:
  - location (string): "West Europe"
  - suffix (string): "tftraining"
  - costalloc (string): "it-hq"
- There is no output value
- Provider "azurerm" should be declared and "configured"
- A declaration of the module "networking" is required

## Step 3 - Execute the deployment

- Is it worth it ?
